Bray/McCannalok Butterfly Valves

Technical Manual

Bray/McCannalok Butterfly Valves

Technical Manual - Table of Contents

<u>Topic</u>	<u>Page(s)</u>
Seating & Unseating Torques	3
Imperial (Lb-Ins).....	4-6
Metric (N-m).....	7-9
Dynamic Torque	10-13
Maximum Shaft Torques (Lb-Ins)	14
Maximum Shaft Torques (N-m)	15
Valve Sizing Coefficients	16
Imperial (Cv).....	17-18
Metric (Kv).....	19-20
Pressure & Temperature Rating (°F & °C)	
With PTFE Seats.....	21
With RTFE Seats.....	22
Flange to Valve Bolting Guide	23

All statements, technical information, and recommendations in this bulletin are for general use only. Consult Bray representatives or factory for the specific requirements and material selection for your intended application. The right to change or modify product design or product without prior notice is reserved.

Seating & Unseating Torques:

Valve orientation to the flow of media affects the torque.
Torque values are presented in two categories:

ASME 150 - Torques (Lb-Ins)

Series 40/41/4A Standard - Valve Differential Pressure (PSIG)

Valve Size Inches	Less than 150 psig		>150-200 psig		>200-250 psig		>250-285 psig

Dynamic Torques:

When a media flows through a butterfly valve, static pressure does not act uniformly on the surfaces of the valve disc. Dynamic torque will cause rotary motion when unchecked by the actuator or manual operator possibly resulting in opening or closing of the valve. If the dynamic torque is of a magnitude that is greater than the bearing and packing friction torque and there is no actuator in place to maintain disc position, the opening or closing action could result in injury to operating personnel or an interruption of the process. Sudden closure (slamming) can cause water hammer damage in lines carrying liquid.

In high performance butterfly valves which have the disc offset from the stem and have non-symmetrical disc faces, **dynamic torque acts to close the valve if the valve is installed with the seat retainer downstream, but can act to close or open the valve, depending on the position of the disc, if the seat retainer is upstream.**

Seat Retainer Upstream

Seat Retainer Downstream

Dynamic torque should be calculated as part of the valve actuator sizing procedure or to determine if hand lever operation is acceptable. In this regard, the total torque of all service conditions must be considered.

The total torque when the disc is in the seat consists of:

1. Seating torque
2. Stem packing torque
3. Eccentricity torque
4. Stem bearing torque

The total torque when the disc is in the seat is published as seating/unseating torque. When the disc is out of the seat, the total torque consists of dynamic torque, stem packing torque, and stem bearing torque.

Total torque changes with the disc position. Maximum total torque can occur at shutoff (disc in the seat), at breakaway (motion initiation), or at any open disc position where the product of valve pressure drop and dynamic torque coefficient peaks in combination with prevailing bearing and packing torque.

Estimating Dynamic Torque

Dynamic torque can be estimated using the following empirical equations:

Liquid Flow:

Imperial $T_d \text{ (Lb-inches)} = C_t D^3 \Delta p$
 Metric..... $T_d \text{ (N-m)} = .0001 C_t D^3 \Delta p$

Gas Flow:

Imperial $T_d \text{ (Lb-inches)} = C_t D^3 Y \Delta p$
 Metric..... $T_d \text{ (N-m)} = .0001 C_t D^3 Y \Delta p$

Dynamic Torque - Terminology

C_t - dynamic torque coefficient (see graphs and tables on Pg. 12 for values of C_t .) Positive value of C_t means that the dynamic torque acts to close the valve and a negative value of C_t to open the valve.

D - nominal valve size (inch or mm)

F_k - ratio of specific heat factor (dimensionless)
 $F_k = k/1.40$ or $F_k = 1$ for air

k - ratio of specific heat (dimensionless)

Δp - effective pressure drop across the valve (psi or bar)

p_1 - valve inlet pressure (psia or bar abs.)

T_d - dynamic torque (Lb-inches or N-m)

$x - x = \Delta p/p_1$

Y - gas expansion factor (dimensionless)
 $Y = 1 - x / (3 F_k x_t)$

x_t - gas critical pressure ratio (dimensionless)
 Values of x_t change with disc position and are identical for seat retainer upstream and downstream.

McCannalok Dynamic Torque Coefficient
Seat Retainer Downstream

Figure 4. Ct values with the Seat Retainer Up Stream
McCannalok Dynamic Torque Coefficient
Seat Retainer Upstream

1. Subchoked Liquid Flow, Line-size Valve.

Example Calculations:

A 24” class 150 McCannalok is to be installed in a 24” line carrying water. It has been determined that the flow is not choked and the following pressure drops through the valve have been calculated:

Data:

- 75 psi with the valve 20 degrees open
- 70 psi with the valve 30 degrees open
- 35 psi with the valve 40 degrees open
- 3.5 psi with the valve 55 degrees open
- 1.1 psi with the valve 60 degrees open
- .20 psi with the valve 70 degrees open
- .05 psi with the valve 80 degrees open
- .03 psi with the valve 90 degrees open

Estimate the maximum dynamic torque in Lb-inches for the valve considering installation with the seat retainer upstream.

$$T_d = C_t D^3 \Delta p$$

Substituting produces following results:

- 20 degrees, $T_d = .020 \times 24^3 \times 75 = 20,700$ Lb-inches, (tends to close the valve)
- 30 degrees, $T_d = .027 \times 24^3 \times 70 = 26,100$ Lb-inches
- 40 degrees, $T_d = .046 \times 24^3 \times 35 = 22,300$ Lb-inches
- 55 degrees, $T_d = .078 \times 24^3 \times 3.5 = 3,800$ Lb-inches
- 60 degrees, $T_d = .086 \times 24^3 \times 1.1 = 1,300$ Lb-inches
- 70 degrees, $T_d = .100 \times 24^3 \times .20 = 300$ Lb-inches
- 80 degrees, $T_d = .032 \times 24^3 \times .05 = 20$ Lb-inches
- 90 degrees, $T_d = -.369 \times 24^3 \times .03 = -150$ Lb-inches, (tends to open the valve)

Thus the peak dynamic torque will occur between 30 and 40 degrees open.

Verify dynamic torque at 35 degrees:

Approximate pressure drop = $(70+35)/2 = 52.5$ psi.
At 35 degrees: $T_d = .037 \times 24^3 \times 52.5 = 27,000$ Lb-inches

The peak dynamic torque of approximately 27,000 Lb-inches occurs at about 35 degrees open.

When sizing the valve operator, total torque must be considered. The total torque when the disc is in the seat consists of seating torque, stem packing torque, eccentricity torque and stem bearing torque. The total torque when the disc is in the seat is published as seating/unseating torque (see pages 1-6. When the disc is out of the seat, total torque consists of dynamic torque, stem packing torque, and stem bearing torque.

2. Choked Gas Flow, Reduced-size Valve.

Example Calculations:

20” (DN 500) class 300 McCannalok butterfly valve is installed in a 600 mm (24”) line flowing air and the disc is set at 45 degrees. The flow is choked. A pressure gauge tapped into the pipe just above the upstream reducer shows 24.5 bar.

Estimate the dynamic torque in N-m, given that the seat retainer is installed downstream.

$D = 500$ mm
 $F_k = 1.0$
 $C_t = .114$
 $Y = .667$ for choked flow
 $p_1 = 24.5 + 1.0 = 25.5$ bar absolute, (1 atm. = 1.013 bar, i.e. about 1.0 bar)
 xt at $45^\circ = .35$

Calculations:

$$\Delta p = p_1 F_k xt$$

$$\Delta p = 25.5 \times 1.0 \times .35 = 8.9 \text{ bar}$$

$$T_d = .0001 C_t D^3 Y \Delta p$$

$$T_d = .0001 \times .114 \times 500^3 \times .667 \times 8.9 = 8,500 \text{ N-m}$$

Thus the dynamic torque at 45° open is about 8,500 N-m, and acts to close the valve.

Valve Sizing Coefficients:

- 1. Valve Sizing Coefficients (Cv)pages 15-16**
 1. Cv stands for Valve Sizing Coefficient.
 2. Cv varies with the valve size, angle of opening and the manufacturer’s valve style.
 3. Cv is defined as the volume of water in USGPM that will flow through a given restriction or valve opening with a pressure drop of one (1) psi at room temperature.

- 2. Valve Sizing Coefficients (Kv)pages 17-18**
 1. Kv stands for Valve Sizing Coefficient.
 2. Kv varies with the valve size, angle of opening and the manufacturer’s valve style.
 3. Kv is defined as the volume of water in Cubic Meters/Hour (m³/hr) that will flow through a given restriction or valve opening with a pressure drop of one (1) bar at room temperature.

Examples of Typical Flange to Valve Bolting*

** Lug Style Bolting

** Wafer Style Bolting

**** Note:** Please refer to Appropriate Bray Dimensional Drawings for specific valve drilling information .

Applies to Wafer and Lug Valves as follows:
ASME Class 150 26" Valves and larger
ASME Class 300 14" Valves and larger
ASME Class 600 10" Valves and larger

Please refer to ASME B-16.5 or B-16.47 for Flange and Bolt Dimension Information

* Double flange style bolting not shown.

** Lug Threads may be tapped from both sides and therefore tap may not be continuous.
